## 总结

下午和晚上好不容易把自己设计的神经网络接口搭好了,采用的是最简单的64->32->16->8->4->2->1、分块形结构,结合了简略的遗传算法。我只用了10个手绘的数字图来做数据,分别对应0到10,拟合其中4个时,效果不错,添加时拟合速度变慢,后面自己加了不少参数上的优化,应该达到了该结构的较优模型,明天打算修改一下网路!

## 效果:

```
find a better model with loss of 10.9042!
Test begin!!
My output:
-0.163732
Standard output:
My output:
1.81239
Standard output:
My output:
2.04543
Standard output:
My output:
2.80601
Standard output:
My output:
3.49666
Standard output:
My output:
5.20098
Standard output:
My output:
Standard output:
My output:
6.71061
Standard output:
Save successful!!
```

第二天的成果可以说时非常泄气的了,早上调参成功把0~6的loss调进了33,然后下午把卷积加上去了,但是效果不大(主要我用的是反向传播的方法),而且跑得慢,成果估计就只有:把框架写好了,然后学会调参和打工程,估计后面会闲置一会,等有灵感再弄。(我发现添加物种毁灭可以让模型有更大的发挥空间,当然,还有别的我认为比较靠谱的筛选策

2 of 3 3/28/18, 11:07 PM

略,但是我觉得限制本模型的关键在于网络如何搭建,这个后面再说),补一张0~10匹配图(project1的,我发现原来的模型可塑性高呀!)

```
Save successful!!
find a better model with loss of 34.8264!
Test begin!!
My output:
